It occurs in all birds' eggs, in which the round, flat germ-disk, commonly called the *cicatricula* or *tread*, may be observed upon the surface of the yellow. In impregnated eggs, even when freshly laid, the germ-disk may be resolved by moderate magnifying power into a flattened mass of little cells which have already arisen by this form of cleavage of the original parent-cell or discocyttula, and have become a discomerula, or even advanced to the stage of a discoblastula or discogastrula.—**Discoidal epipleura**, in *entom.*, borders of the elytra which are strongly deflexed, appearing like processes of the lower surface of the disk. *Kirby*.—**Discoidal nervures**, in *entom.*, the nervures in the center of the wing, entirely unconnected with other nervures, as in certain *Coleoptera*.—**Discoidal placenta**, a placenta or afterbirth which has the form of a circular flattened cake, as that of man, monkeys, bats, insectivores, and the rodents.

Discomedusæ (dis'kō-mē-dū'sē), *n. pl.* [NL., *pl. of Discomedusa*.] An order of the class *Hydrozoa* and subclass *Scyphomedusæ*, including the discophorous hydrozoans, or *Discophora* in a strict sense, as those aculeaphs commonly called jelly-fishes: so called from the large umbrella-like disk which these organisms possess. Most jelly-fishes belong to this order. They are technically characterized as *Scyphomedusæ* which develop as sexual medusiform individuals by transverse fission from a scyphistoma (which see), or else directly from the egg; with 4 perardial, 4 interradial, and sometimes accessory adradial tentaculicysts; 4 or 8 genital lobes developed from the endoderm forming the oral floor of the enteric cavity, which is extended into 4 or 8 pouches; and with the mouth either opening simply at the end of a rudimentary manubrium or provided with 4 or 8 arm-like processes. According to the character of the mouth, the *Discomedusæ* are divided into three suborders, *Cubozostoma*, *Semostoma*, and *Rhizostoma*. To the last of these belongs the genus *Cephea*. (See cut under *Discophora*.) The order as here defined is contrasted with the three orders *Lacerariæ*, *Conomedusæ*, and *Peromedusæ*, and is included with them in the subclass *Scyphomedusæ*. Characteristic genera of discomedusans are *Discomedusa* and *Nautilothoe* among the simple cubozostomous forms; the semostomous *Chrysaora*, *Pelagia*, *Cyanea*, and *Aurelia*; and the rhizostomous *Cephea*, *Cassiopeia*, and *Rhizostoma*. The term *Discomedusa* has also been wrongly extended to other scyphomedusans, thus becoming synonymous with the subclass *Scyphomedusæ*, or with *Discophora* in one of its senses.

2. In math., that character of a change which consists in a passage from one point, state, or value to another without passing through a continuously infinite series of intermediate points (see *infinite*); that character of a function which consists in an infinitesimal change of the variables not being everywhere accompanied by an infinitesimal change (including no change) of the function itself. An essential discontinuity is a discontinuity in which the value of the function becomes entirely indeterminate.

And writhed him to and fro convolved; so sore
The griding sword with *discontinuous* wound
Pass'd through him. Milton, P. L., vi. 329.

3. In math. See the extract.

The term *discontinuous*, as applied to a function of a single variable, has been used in two totally different senses. Sometimes a function is called *discontinuous* when its algebraic expression for values of the variable lying between certain limits is different from its algebraic expression for values of the variable lying between other limits. Sometimes a function of x , $f(x)$, is called continuous when, for all values of x , the difference between $f(x)$ and $f(x+h)$ can be made smaller than any assignable quantity by sufficiently diminishing h , and in the contrary case *discontinuous*. If $f(x)$ can become infinite for a finite value of x , it will be convenient to consider it as *discontinuous* according to the second definition. Stokes.

discontinuously (dis-kon-tin'ū-us-li), *adv.* In a discontinuous manner; with discontinuity.

Continual drinking is most convenient to the distemper of an hydroptic body, though most *disconvenient* to its present welfare. Sp. Reynolds, On the Passions, xl.

Discophora (dis-kof'ō-rā), *n. pl.* [*NL.*, neut. pl. of *discophorus*: see *discophorous*.] **1.** The discoidal hydrozoans, a subclass of *Hydrozoa*, comprising most of the organisms known as jelly-fishes, sea-jellies, or sea-nettles. The latter name is given them from the power they possess, like other hydrozoans, of stinging by means of their thread-cells. The hydrosome consists of a single umbrella-like disk, by the

rhythmical contraction of which the creature swims, and from the center of which hangs a single polypite or digestive individual, or, less frequently, several. They are free-swimming oceanic animals, whose body consists of such soft gelatinous substance that a specimen weighing several pounds when alive weighs when dried hardly as many grains. The *Discophora* include many aculephs, in the usual sense of that term, and are also called *Medusæ*, *Ephyromedusæ*, and *Acropedæ*. They have been divided into *Calycozoa* (lucernarians), *Rhizostomea*, and *Monostomea*. The term *Discophora* is also restricted to the last two of these, excluding the *Lucernaria*. Thus, by Claus, the *Discophora* are made a suborder of *Scyphomedusæ*, synonymous with *Acropedæ*, and characterized as disk-shaped aculephs with the margin of the disk 8-lobed, at least 8 submarginal sense-organs, as many ocular lobes, and 4 great cavities in the umbrella for the generative organs. In this strict sense the *Discophora* correspond to the *Discomedusæ* (which see). For several wider and inconsistent uses of the term, see the extract.

The binary division of the *Hydrozoa* was established by Eschscholtz (1829), whose *Discophora phanero-carpeæ* correspond to the *Scyphomedusæ*, whilst his *Discophora crypto-carpeæ* represent the *Hydromedusæ*. The terms point to distinctions which are not valid. In 1853 Kölliker used the term *Discophora* for the *Scyphomedusæ* use alone, an illegitimate limitation of the term which was followed by Louis Agassiz in 1860. Nicholson has used the term in a reverse sense for a heterogeneous assemblage of those medusæ not classified by Huxley as *Lucernariæ*, nor yet recognized as derived from hydroid trophosomes. This use of the term adds to the existing confusion, and renders its abandonment necessary. . . . The term *Discophora* is used by Claus for the *Discomedusæ*.

Encyc. Brit., XII. 556.

discount (dis'kount), *n.* [= *OF. descompte, F. décompte = Sp. descuento = Pg. desconto = It. sconto, formerly disconto (< D. G. disconto = Dan. diskonto = Sw. diskont), < ML. discomputus, discount; from the verb: see discount, v.*] 1. An allowance or deduction, generally of so much per cent., made for prepayment or for prompt payment of a bill or account; a sum deducted, in consideration of cash payment, from the price of a thing usually sold on credit; any deduction from the customary price, or from a sum due or to be due at a future time.—2. In finance, the rate per cent. deducted from the face value of a promissory note, bill of exchange, etc., when purchasing the privilege of collecting its amount at maturity. *Bank discount* is simple interest paid in advance, and reckoned, not on the sum advanced in the purchase, but on the amount of the note or bill. This is the method recognized in business and in law. *True discount* is a technical term for the sum which would, if invested at the same rate, amount to the interest on the face value of the note or bill when due; thus, \$5 is the bank discount at the rate of 5 per cent. on a bill drawn at twelve months for \$100; while \$4.7619 is the true discount, because that sum if invested at 5 per cent. would at the end of a year amount to \$5. *True discount* may be found by multiplying the amount of a bill or note by the rate of discount and dividing by 100 increased by the rate; while bank discount is computed in the same manner as simple interest.

3. The act of discounting: as, a note is lodged in the bank for discount; the banks have suspended discounts.—4. In billiards, an allowance made by a superior to an inferior player of a deduction of one count from his string for every count made by the latter. A *double discount* deducts two counts for one; a *three discount*, three; and so on up to the *grand discount*, which deprives the player who discounts his opponent (gives the odds) of all prior counts whenever the latter makes a successful shot.—At a discount, below par; hence, in low esteem; in disfavor.

dismal (diz'mäl), *a.* and *n.* [Early mod. E. also
dismall, diesmall, dismodl, dysmel, dysemel; <
ME. dismal, dissmall, dismale, disemal, dysmial,
 found first as a noun in the phrase "in the *dism-*
mal" (see quot. under *IL*, 1), of which the orig.
 meaning is not certain, but which prob. stands
 for "in the *dismal* days or time," the word be-
 ing most frequent in the phrase *dismal day* or
dismal days (see quot. under *I*). The origin
 and meaning of the word have been much de-
 bated. It was certainly borrowed, and prob.
 from the *OF.* From its lack of a recognized
 literal meaning in E., it must have been bor-
 rowed in a figurative sense. "It is just possible
 that the original sense of *in the dismal* [*days*
or time] was in *titling time*; with reference to the
 cruel extortion practiced by feudal lords, who
 exacted *tenths* from their vassals even more
 peremptorily than tithes were demanded for the
 church." (Skeat.) This view, which is prob. cor-
 rect, is based upon what appears to be phoneti-
 cally the only possible origin of *ME. dismal*,
 namely, < *OF. *dismal*, *F. *dimal* (vernacular
 form of *decimal*, *F. décimal*) = *Sp. diezmal* = *Pg.*
dizimal, *Sp. Pg.* also *decimal* = *E. decimal*, <

 tenth, *ML. fem. decima*, a tenth, a tithe, > *OF.*
disme, *F. dime*, *ME. disme*, *E. dime*, a tithe,
 tenth: see *decimal* and *dime*. The notion of
 official extortion appears further in the related
OF. dismer, dismer, decimate, exact tithes,
 hence *despoil* (= *Sp. diezmar* = *Pg. dizimar*, pay
 tithes, decimate: see *decimate*), and in *eschear*,
cheat, *q. v.*] **I. a.** Gloomy; dreary; cheerless;
 melancholy; doleful; dolorous: originally, as

M. C. Tyler, Hist. Amer. Lit., I. 85.

3. In optics, the separation of the different colored rays in refraction, arising from their different wave-lengths. The point of dispersion is the

point where refracted rays begin to diverge. When a ray of sunlight is made to pass through prisms of different substances, but of such angles as to produce the same mean deviation of the ray, it is found that the spectra formed are of different lengths. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism; the oil of cassia is therefore said to disperse the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the colored spaces have to one another ratios differing from the ratios of the lengths of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the colored spaces in the spectrum. See *prism* and *refraction*.

Dispersion has been accounted for by the different speeds of light of different wave-lengths in the same refracting medium. *Tait*, Light, § 72.

In consequence of . . . *dispersion* of the colours in various directions of vibration, white light becomes broken up in a mode which is comparable with the *dispersion* of colour by ordinary refraction, and on this account has received the name of circular or rotary *dispersion*.

Lommel, Light (trans.), p. 334.

4. In *med.* and *surg.*, the scattering or removal of inflammation from a part and the restoration of the part to its natural state.—5. In *math.*, the excess of the average value of a function at less than an infinitesimal distance from a point over the value at that point, this excess being divided by $\frac{1}{2}$ of the square of the limiting infinitesimal distance.—**Abnormal dispersion**, in optics, a phenomenon exhibited by solutions of some substances, as fuchsin, which give spectra differing from the usual prismatic spectrum in the order of the colors.—**Conc. of dispersion**. See *conc.*—**Dispersion of the bisectrices**, in crystal, the separation of the bisectrices for different colors observed in many monoclinic and triclinic crystals when the position of the three axes of light-elasticity is not the same for all the rays of the spectrum. It may be *crossed*, *horizontal*, or *inclined*. It is *crossed* when the acute bisectrix coincides with the orthodiagonal axis. When a section of a biaxial crystal cut normal to the acute bisectrix is viewed in converging polarized light, the dispersion of the optic axes or bisectrices is generally marked by the arrangement of the colors in the interference figures seen. It is *horizontal* when the obtuse bisectrix coincides with the orthodiagonal axis; and *inclined*, in monoclinic crystals, when the optic axes lie in the plane of symmetry.—**Dispersion of the optic axes**, in crystal, the separation of the axes for different colors in biaxial crystals, which takes place when the axial angles have different values; it is usually described as $> v$, or $< v$, according as the angle for red rays is greater or less than that for blue rays.—**Epipollic dispersion**. See *epipollic*.

Pasteur considers to be the exclusive attribute of life. Tyndall, Int. to Life of Pasteur, p. 17.

In Eastern countries and in some districts of Europe, especially in Italy, the primitive distaff and spindle are still used; but after the introduction of the spinning-wheel into Europe, about the fifteenth century, the distaff became an attachment only of that designed for flax, and thus continued in general use till a recent period, modified in form.

2. The volatilization and subsequent condensation of a liquid by means of an alembic, a still and refrigeratory, or a retort and receiver; the operation of obtaining the spirit, essence, or essential oil of a substance by the evaporation and condensation of the liquid in which it has been macerated; rectification; in the widest sense, the whole process of extracting the essential principle of a substance. The most common method of conducting the process of distillation consists

in placing the liquid to be distilled in a boiler of copper or other suitable material, called the still, having a movable head from which proceeds a coiled tube called the worm, which passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized, and rises in vapor into the head of the still, whence, passing down the curved tube or worm, it becomes condensed by the cold water, and makes its exit in a liquid state. The object of distillation is to separate volatile liquids from non-volatile liquids and solid matters, and also, by the operation called *fractional distillation* (which see, below), to separate from each other volatile liquids which have different boiling-points. The process is used in the arts, in the manufacture of alcohol and spirituous liquors, for preparing essences and essential oils, and for a great variety of other purposes.

The mixture is distilled in an apparatus which admits of constant observation of the temperature, and the liquids obtained between certain intervals of temperature (five or ten degrees) are collected separately. The more volatile liquid will be found chiefly in the "fractions" first collected; and by repeating the process with the first fraction, this more volatile liquid may be obtained in a state of comparative or absolute purity.

In form it is ovate, flattened, and presents two suckers (whence the name), of which the anterior is perforated by the oral aperture, and the posterior median one is approximated to it; there is a complicated branched water-vascular system; the intestine is branched and without an anus. It has been shown that the ciliated embryo passes into *Limnaea truncatula*, and there gives rise to a sporocyst which develops reticulate, which produce other reticulate, or cercariae, which are tadpole-like larvae; these after swimming for a time become encysted, as, for example, on blades of grass, and in this state are eaten by sheep. Numerous species of the genus are described. *D. hæmatobium*, from the veins of man, is now referred to the genus *Bilharzia*. See cut under *cercaria*.

A limited extent of country marked off for a special purpose, administrative,

political, etc.; a circuit or territory within which may be exercised or to which are limited certain rights or powers; any portion of land or country, or any part of a city or town, which is defined by law or agreement. In British India and in various European countries a district is a subdivision of a province. In reference to political divisions in the United States, it generally imports that the inhabitants act together for some one specific purpose: as, a *highway district*; a *school district*; an *election district* (as a senate, assembly, or congressional district). In some States the term is applied to a class of towns. In South Carolina, during most of the period from 1768 to 1868, the chief subdivision of the State (excepting the coast region) was called a *district*, instead of a county as in the other States. In Virginia and West Virginia the chief subdivision of a county is called a *municipal district*, with reference to the organization of local justice. In Tennessee it is called a *civil district*; in Kentucky, a *justice's district*; in Georgia, a *militia district*; in Maryland, an *election district*. In other States these divisions are called *towns* or *townships*. In colonial and provincial Massachusetts the district was a part set off from a town and made independent of it in respect to local administration, but not in respect to choosing a representative to the General Court. In the Methodist Episcopal Church the district is a territorial subdivision of a conference, comprising a number of churches and societies, under the charge of a presiding elder. A *military district* of a country is a division of a military territorial department. The federal territory containing the national capital is called the *District of Columbia*. Abbreviated *dist.*

[*L. dithyrambus*, *< Gr. δῖθυρος*, origin unknown.] A form of Greek lyric composition, originally a choral song in honor of Dionysus, afterward of other gods, heroes, etc. First given artistic form by Arion (about 625 B. C.) and rendered by cyclic choruses. It was perfected, about a century later, by Lasos of Hermione, and at about the same time tragedy was developed from it in Attica. Its simpler and more majestic form, as composed by Lasos, Simonides, Bacchylides, and Pindar, assumed in the latter part of the fifth century a complexity of rhythmical and musical form and of verbal expression which degenerated in the fourth century into a mimetic performance rendered by a single artist. From these different stages in its history the word *dithyramb* has been used in later ages both for a nobly enthusiastic and elevated and for a wild or inflated composition. In its distinctive form the *dithyramb* is ἀλλοιόστροφος (consists of a number of strophes no two of which are metrically identical).

There are three leading species: the great northern diver, *Columbus torquatus*; the black-throated diver, *C. arcticus*; and the red-throated diver, *C. septentrionalis*. All three inhabit the northern hemisphere generally, and are noted not only for their quickness in diving, but also for the length of time they remain and the distance they traverse under water, in which they move both by swimming with the feet and by paddling with the wings. See *loon*. Also *diving-bird*.

3. To differ from a typical form; vary from a normal state or from the truth.—4. In *math.*, to become larger (in modulus) without limit: said of an infinite series when, on adding the terms, beginning with the first, the sum increases indefinitely toward infinity. A series may be *divergent* without *diverging*. See *divergent series, under divergent*.

divergement (di-vér'jment), *n.* [*< diverge + -ment.*] The act of *diverging*. *Clarke.* [Rare.]

Amer. Jour. Philol., V. 494.

3. In *math.*, the negative of the scalar part of the result of operating with the Hamiltonian operator upon a vector function. Concave lenses render parallel rays *divergent*; convex lenses *convergent*.—*Divergent series*, an infinite series such that, if we begin adding the terms together in their order, we do not ultimately approximate indefinitely toward a finite limit, but either oscillate from one value to another or move toward infinity. Only in the latter case, according to the usage of mathematicians, is a *divergent series* said to *diverge*. Thus, for instance, the infinite series 1 - 1 + 1 - 1 + 1 - 1 + 1 is *divergent* without *diverging*.—*Divergent strabismus*. See *strabismus*.—*Divergent wings*, in *entom.*, wings which in repose are horizontal but spread apart, receding from the abdomen, as in many flies.

It. diverso, < L. diversus, various, different, also written divorsus, ppr. of divortere, divortere, turn or go different ways, part, separate, divert: see divert.* According to modern analogies, the word *divers* would be written *diverse* (pron. di-vérz); association with the *F.* original favored the spelling *divers*; and this form, with the plurality involved in the word, caused it to be regarded as a plural (whence the pron. di-vérz). Hence in mod. speech *divers* is used only with a plural noun. It is now obsolete or archaic, the form *diverse*, regarded as directly from the *L.*, having taken its place. In earlier use *divers* and *diverse* are merely different spellings of the same word; early quotations are therefore here all put under *divers*. See *diverse*.] 1. Divine assistance. See *assistance*.—**Divine office**, the stated service of daily prayer; the canonical hours.—**Divine right**, (*a*) *Of kings*, the doctrine that the king stands toward his people in *loco parentis*, deriving his authority, not from the consent of the governed, but directly from God. This doctrine, which in English history was especially developed under the Stuarts, though still held by some as a matter of theory, has generally ceased to have practical political significance.

The *Divine right of kings*, independent of the wishes of the people, has been one of the most enduring and influential of superstitions, and it has even now not wholly vanished from the world. Lecky, Europ. Morals, II. 285.

(*b*) *Of the clergy*, a claim of divine authority for particular persons and particular forms of ecclesiastical government. An instance in the Roman Catholic Church is the still unsettled claim of the bishops to power in their several dioceses, as opposed to the papal theory that they rule mediately through the pope.—**Divine service**, the public worship of God; especially, the stated or ordinary daily and Sunday worship; in the Roman Catholic and Anglican churches, the hours or the daily morning and evening prayer, and the celebration of the eucharist.—**Tenure by divine service**, in *Eng. law*, an obsolete holding, in which the tenants had to perform certain religious services, as to sing a specified number of masses, expend a certain sum in alms, etc.—**The divine remedy** (*divinum remedium*), the root of *Imperatoria ostruthum*, or masterwort, which was formerly highly esteemed in medicine, but seems to have few virtues except those of an aromatic stimulant. = *Syn. 2. Holy, sacred*.—**3.** Supernatural, superhuman.

The divineress ought to have no perturbations of mind, or impure passions, at the time when she was to consult the oracle; and if she had, she was no more fit to be inspired than an instrument untuned to render an harmonious sound. *Dryden, Plutarch.*

diving-beetle (di'ving-bé'tl), *n.* A popular name for various aquatic beetles of the family *Dytiscidae*. They swim freely in the water, and may often be seen diving rapidly to the bottom, whence their name. See cut under *Dytiscus*.

diving-bell (di'ving-bel), *n.* A mechanical contrivance consisting essentially of an inverted cup-shaped or bell-shaped chamber filled with air, in which persons are lowered beneath the surface of the water to perform various operations, such as examining the foundations of bridges, blasting rocks, recovering treasure from sunken vessels, etc. Diving-bells have been made of various forms, such as that of a bell, or a hollow truncated cone or pyramid, with the smaller end closed and the larger one, which is placed lowermost, open. The air contained within the bell prevents it from being filled with water on submersion, so that the diver may descend in it and breathe freely, provided he is furnished with a new supply of fresh air as fast as the contained air becomes vitiated by respiration. The diving-bell is now generally made of cast-iron in the form of an oblong chest (A), open at the bottom, and with several strong convex lenses set in its upper side or roof, to admit light to the interior. It is suspended by chains from a barge or other suitable vessel, and can be raised or lowered at pleasure, in accordance with signals given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of a forcing-pump (B) placed in the vessel, while the vitiated air escapes by a cock in the upper part of the bell. An improvement on this form, called the *nautilus*, enables the occupant, instead of depending upon the attendants above, as in the older forms, to raise or sink the bell, move it about at pleasure, or raise great weights with it and deposit them in any desired spot.

Diving-bell.

diving-bird, *n.* Same as *diver*¹, 1 (b).

diving-buck (di'ving-buk), *n.* A book-name of the antelope *Cephalophus mergens*, translating the Dutch name *duykerbok* (which see): so called from the way in which the animal ducks or dives in the brush. See cut under *Cephalophus*.

diving-spider (di'ving-spi'dér), *n.* An aquatic spider, *Argyroneta aquatica*, which builds its nest under water, and habitually dives to reach it, carrying down bubbles of air, with which it fills its nest on the principle of the diving-bell. It is thus enabled to remain under water, though fitted only for breathing air. See cut under *Argyroneta*.

diving-stone (di'ving-stôn), *n.* A name given to a species of jasper.

divining-rod (di-vi'ning-rod), *n.* A rod or twig used in divining; especially, a twig, generally of hazel, held in the hand and supposed by its bending downward to indicate spots where met-

alliferous deposits or water may be found by digging. It is usually made of two twigs of hazel, or of apple or some other fruit-tree, tied together at the top with thread, or of a naturally forked branch, and is grasped by both hands in such a way that it moves when attracted by the sought-for deposit. This method of searching for ore or water has been in use for centuries, but its efficacy is now rarely credited by intelligent persons.

Shall we have most likelihood of success if we dig from east to west, or from west to east?—or will you assist us . . . with your divining-rod of witches-hazel?

divisi (dē-vē'zē), [*It. pl. of diviso, < L. divisus, pp. of dividere, divide.*] In music, separate: a direction that instruments playing from a single staff of music are to separate, one playing the upper and the other the lower notes.

divisibility (di-viz-i-bil'i-ti), *n.* [= *F. divisibilité = Sp. divisibilidad = Pg. divisibilidad = It. divisibilità, < ML. *divisibilita(-t-), < LL. divisibilis, divisible: see divisible.*] 1. The capacity of being divided or separated into parts.—2. In arith., the capacity of being exactly divided—that is, divided without remainder.—**Infinite divisibility**, the character of being divisible into parts which are also divisible, and so on ad infinitum. As applied to matter, the term implies properly that any portion of matter may, by the exercise of sufficient force, be separated into parts. After the general acceptance of the Daltonian theory of atoms, the term *infinite divisibility of matter* was long retained with the meaning of the infinite divisibility of space.

The geometricians (you know) teach the divisibility of quantity in infinitum, or without stop, to be mathematically demonstrable. *Boyle, Things above Reason.*

I said at first that infinite divisibility of matter was the doctrine now in vogue amongst the learned, but upon second thoughts I believe I have misrepresented them, and the mistake arose from want of distinguishing between infinite and indefinite divisibility.

A. Tucker, Light of Nature, III. iii. § 12.

divisible (di-viz'i-bl), *a.* and *n.* [= *F. divisible = Sp. divisible = Pg. divisible = It. divisible, < LL. divisibilis, divisible, < L. dividere, pp. divisi, divide: see divide.*] 1. a. 1. Capable of division; that may be separated or disunited; consisting of separable parts or elements: as, a line is divisible into an infinite number of points.

Huxley, Anat. Invert., p. 546.

2. In arith., capable of division without remainder: as, 100 is divisible by 10.

Sw. division, < L. divisio(-n-), division, < dividere, pp. divisus, divide: see divide.*] 1. The act of dividing or separating into parts, portions, or shares: as, the division of a word (as by means of a hyphen at the end of a line); the division of labor; the division of profits.

I'll make division of my present with you:

Hold, there is half my coffer. *Shak., T. N.*, III. 4.

Specifically.—(a) [*L. divisio(-n-), tr. of Gr. διαίρεσις.*] In logic, the enumeration and naming of the parts of a whole; especially, the enumeration of the species of a genus. The latter is also distinguished as *logical division*. Division is mainly distinguished from classification in that the latter is a modern word, and supposes minute observation of the facts, while the former, as an Aristotelian term, denotes a much ruder proceeding, based on ordinary knowledge, and undertaken at the outset of the study of the genus divided. One of the distinctive doctrines of the Ramist school of logicians was that all division should proceed by dichotomy.

Division is a dividing of that which is more commune into those which are lesse commune. As a definition therefore dooth declare what a thing is, so the division sheweth how many things are contained in the same.

Sir T. Wilson, Rule of Reason (1551).

Division is the parting or dividing of a word or thing that is more general, unto other words or things less general.

Blundeville, Arte of Logike (1599), II. 3.

(b) In her., the separating of the field by lines in the direction of the bend, the bar, etc. (called *division bendwise*,

harrise, etc.), also for the purpose of impaling two shields together, or in quartering. (c) The separation of members in a legislative house in order to ascertain the vote. This is effected in the British House of Commons by the passing of the affirmative and negative sides into separate lobbies, to be counted by tellers; in American legislatures, by their rising alternately, or, as is frequently done in the House of Representatives, by passing between tellers standing in front of the Speaker's desk. In the British House of Commons the usual method of voting on any contested measure is by division; in the United States, by ayes and noes, or affirmative and negative answers on a call of the roll.

The motion passed without a *division*. Macaulay.

2. In *math.*: (a) The operation inverse to multiplication; the finding of a quantity, the quotient, which, multiplied by a given quantity, the divisor, gives another given quantity, the dividend. In elementary arithmetic division is often defined as, for example, "the partition of a greater summe by a lesser" (*Recorde*, 1540); but such a definition applies only when the quotient is an abstract number and an integer. Division is denoted by various signs. Thus, a divided by b may be written in any of the following ways:

$$a \div b, \frac{a}{b}, a/b, a:b, ab^{-1}.$$

Where multiplication is not commutative (that is, where xy is not generally equal to yx) there are two kinds of division; for if $xy = x$, x may be regarded as the quotient of x divided by y , or y as the quotient of x divided by x . These two kinds of division are denoted as follows:

$$xy \div y = x, \frac{xy}{y} = x, xy/y = x, x \cdot y^{-1}(xy) = y.$$

Division is one of the fundamental operations in arithmetic, common algebra, and quaternions; but in other forms of algebra it generally gives an indeterminate quotient, and so loses its importance. (b) A rule or method for ascertaining the quotient of a divisor into a dividend: as, long *division*. (c) A section; the separation of a geometrical figure into two parts.—3. The state of being divided; separation of parts: as, an army weakened by *division*; *divisions* among Christians.

Hate is of all things the mightiest divider; nay, is *division* itself. Milton, *Divorce*, li. 21.

4. That which divides or separates; a dividing line, partition, or mark of separation; any sign or cause of separation or distinction.

I will put a *division* between my people and thy people. Ex. viii. 23.

5. A part separated or distinguished in any way from the rest; a minor part or aggregate; a distinct portion: as, the *divisions* of an orange; a *division* of mankind or of a country; the *divisions* of a book or of a discourse.

Express the heads of your *divisions* in as few and clear words as you can. Swift.

Specifically.—(a) A definite part of an army or of a fleet, consisting of a certain number of brigades or of vessels under a single commander.

For his *divisions*, as the times do brawl,
Are in three heads; one power against the French,
And one against Glendower; perforce, a third
Must take up us. Shak., 2 Hen. IV., i. 3.

(b) A part of a ship's company set apart for a certain service in action. Those who serve at the guns are classed as the *first*, *second*, *third*, and *fourth divisions*; the *powder division* provide the guns with ammunition; the *master's division* steer the ship and work the sails; and the *engineer's division* manage the engines and the boilers. (c) A geographical military command, consisting of two or more departments. Thus, the Military *Division* of the Missouri consists of the department of Dakota, the department of the Platte, the department of the Missouri, and the department of Texas. The United States is divided for military purposes at the present time (1889) into three divisions—the divisions of the Atlantic, the Missouri, and the Pacific. (d) In *nat. hist.*: (1) In zoological classification, any group of species forming a part of a larger group: in entomology, sometimes specifically applied to a group smaller than a suborder and larger than a family, as the *division Gymnocerata* of the *Heteroptera*. A *section* may be equivalent in value to a *division*, or a group subordinate to it; a *series* is a *division* in which the minor groups show a regular gradation in structure. (2) In botanical classification, one of the higher grades in the sequence of groups, equivalent to *subkingdom* or *series*, as the *phenogamous* and *cryptogamous divisions* of plants. It is also often used as subordinate to *class*, as the *polypetalous*, *apetalous*, etc., *divisions* of dicotyledonous plants. By some authors it has been used to designate a grade between *tribe* and *order*.

6. The state of being divided in sentiment or interest; disunion; discord; variance; difference.

There was a *division* among the people. John vii. 43.

Between these two
Division smoulders hidden.

Tennyson, *Princess*, iii.

Earth, these solid stars, this weight of body and limb,
Are they not sign and symbol of thy *division* from Him?
Tennyson, *The Higher Pantheism*.

7. In *music*, a rapid and florid melodic passage or phrase, usually intended to be sung at one breath to a single syllable: so called because originally conceived as the elaboration of a phrase of long tones by the division of each

into several short ones. It was common in the music of the eighteenth century.

Sweet as ditties highly penn'd,
Sung by a fair queen in a summer's bower,
With ravishing *division*, to her lute.

Shak., 1 Hen. IV., iii. 1.

Music, advance thee on thy golden wing,
And dance *division* from sweet string to string.

Middleton, *Blurt, Master-Constable*, i. 1.

Now that the manager has monopolized the Opera-house, haven't we the signors and signoras calling here, sliding their smooth semibreves, and gargling glib *divisions* in their outlandish throats?

Sheridan, *The Critic*, i. 1.

8. The precise statement of the points at issue in any dispute. [Rare.]

The *division* is an opening of thyngs wherein we agree and rest upon, and wherein we stick and stand in trayers, shewing what we have to saie in our owne behaife.

Sir T. Wilson, *Rhetoric* (1553).

9. See the extracts.

At the University of Cambridge, England, each of the three terms is divided into two parts. *Division* is the time when this partition is made.

B. H. Hall, *College Words*.

The terms are still further divided, each into two parts; and, after *division* in the Michaelmas and Lent terms, a student who can assign a good plea for absence to the College authorities may go down and take holiday for the rest of the time.

C. A. Brinded, *English University*, p. 87.

Accidental division, a division of a subject according to its accidents: as, good things are, according to Aristotle, either qualities of mind, qualities of body, or accidents of fortune.—**Centesimal division**. See *centesimal*.

—**Complementary division**, a method of division given by Boethius. The smallest round number larger than the

divisor is used, and also the complement of the divisor, or the remainder after subtracting it from the round number.

The first figure of the quotient is set down, from the dividend is subtracted the product of this by the round number, and to the remainder is added the product of the same figure of the quotient by the complement of the divisor. The sum is treated as a new dividend.—**Complex or compound division**, the division of a complex or compound number either by a number of the same sort or by an abstract number, as the division of 3 days 13 hours 17 minutes by 1 day 18 hrs 23 minutes 56 seconds, or by 7.—**Direct division**. (a) Division not complementary. (b) A rule for dividing one number by another, so as to obtain the entire period of the circulating decimal of the quotient.

Both dividend and divisor are multiplied by the same number so as to make the last significant figure of the divisor 9. By striking off from the divisor so multiplied the 9, together with any ciphers which may follow it, and increasing the truncated remnant by 1, a number is obtained called the current multiplier. The last figure of the multiplied dividend is now struck off, multiplied by the current multiplier, and the product added to the truncated dividend. The sum is treated as a new dividend; and this process is continued until the dividends begin to repeat themselves. The successive figures struck off from the dividend from last to first are now written down from left to right as a whole number, and subtracted from the circulating part of the same figures repeated indefinitely into the decimal places. The remainder, after shifting the decimal point as many places to the left as there were zeros struck off from the divisor along with the 9, is the quotient sought.

—**Division by circulating decimals**, a method of dividing by means of a table of circulating decimals.—**Division by factors**, the process of dividing successively by factors of the divisor.—**Division by logarithms**, a method of dividing based on the fact that the logarithm of the quotient is the logarithm of the dividend diminished by the logarithm of the divisor.—**Division of a ratio**, the reduction of a proportion from $a:b::c:d$ to $b:a::d:c$ —**Division of labor**, in *polit. econ.*, the dividing up of a process or an employment into particular parts, so that each person employed can devote himself wholly to one section of the process.—**Division of the question**, in a legislative body, the division of a complex proposition or motion into distinct propositions, in order that each may be considered and voted upon separately: a course resorted to, upon motion or demand, when any of the members favor parts but not the whole of the measure. The presiding officer usually has the power of deciding whether such division is admissible.—**Division viol**. See *viol*.—**General division**. See *general*, n.—**Golden division**, arithmetical division not complementary.—**Harmonic division** of a line. See *harmonic*.

—**Iron division**. Same as *complementary division*.—**Logical division**, any division not a partition, being either a nominal, substantial, or accidental division.—**Long division**, the common modern method of arithmetical division when the divisor is a number larger than 10. The greatest number of times that the divisor is contained in the first figures of the dividend, beginning with the left (a sufficient number being taken to make a number greater than the divisor), is set down to the right of the dividend, as the first figure of the quotient; the divisor is then multiplied by this quotient, and the product is subtracted from the left-hand part of the dividend; to the remainder the next figure to the right in the dividend is then annexed, and the number thus formed is treated as a new dividend; and so on. The same method is extended in algebra to the division of polynomials in general. The rule is of Italian origin. See *scratch division*.

—**Nominal division**, an enumeration of the different senses of an equivocal word or expression; a distinction.

—**Partible division**, the mental division of a whole into its parts, as of the English nation into sovereigns, lords, and commons; partition.—**Real division**, a division relating to facts, not a mere distinction between different meanings of a word, embracing substantial, partible, and accidental division; the explication of a whole by its parts.

—**Scratch division**, the ordinary method of division before long division came into general use, late in the seventeenth century. The products were not set down at all, but only the remainders. The divisor was set down under the dividend; the first figure of the quotient was then set

down and was multiplied by the first figure of the divisor, and the remainder was set down over the corresponding figures of the dividend, which were immediately canceled, together with the first figure of the divisor. This process having been repeated until the whole divisor had been canceled, the latter was written down again one place further to the left, the second figure of the quotient was set down, and the whole proceeding repeated until a remainder was obtained less than the divisor. The following shows the successive stages of the division of 351 by 13:

$$\begin{array}{r} 27 \\ 13 \overline{) 351} \\ \underline{26} \\ 91 \\ \underline{78} \\ 130 \\ \underline{117} \\ 13 \end{array}$$

The rule was derived from Arabian writers.—**Short division**, a process of division practised with a divisor not larger than 10, in which the quotient is set down directly, being written from left to right, usually below a line under the dividend, without auxiliary figures.—**Substantial division**, or *division per se*, the division of a genus into its species.—**To run division**, in *music*, to make florid variations on a theme.

Running *division* on the panting air.

B. Jonson, *Poetaster*, iv. 3.

The orig. sense 'put' appears especially in the compounds, originally contractions, of *do* with a following adverb, namely, *don* (< *do on*), *doff* (< *do off*), *dout* (< *do out*), *dup* (< *do up*). Peculiar inf. forms, consisting of *do* combined with the prepositional sign, appear as nouns in *ado* and *to-do*. Deriv. *deed*, *doom*, *deem*, *-dom*, etc. Cf. *do2*. *do*⁴ (dō), *n.* [A mere syllable, more sonorous
than *ut*, for which it is substituted.] In *solmi-*
zation, the syllable now commonly used for the
first tone or key-note of the musical scale, and
also for the tone C (as the key-note of the typi-
cal scale of the pianoforte keyboard). About
1670 it replaced the Aretinian *ut*, which is still somewhat
used in France. In the tonic sol-fa system it is spelled
doh, and indicated by its initial *d*; its significance is limited
to the first tone of the scale, without reference to the
keyboard. In teaching sight-singing by the help of *solmi-*
zation, two general methods are in use: (a) the *fixed-do*
method, in which *do* is always applied to tones bearing
the letter-name C, whether they are key-notes or not; and
(b) the *movable-do* method, in which *do* is always applied
to the key-note, whatever be its letter-name. The second
method is generally regarded as the more scientific, and
is far the more practical, although the first has had the
support of many excellent musicians.

dock³ (dok), *n.* [*MD. docke* = *D. dok* = *Flem. dok*, a dock; cf. (from the *E.* or *D.*) *Sw. docka* = *Dan. dok*, *doke* = *G. dock*, *doke* = *F. dock*, a dock. Origin unknown; cf. *OFlem. docke*, a cage (see *dock*⁴); *Ice. dökk*, *dökkh*, a pit, pool, = *Norw. dokk*, *dekk*, *dekt*, a hollow, low ground surrounded by hills. The word is by some connected with *It. doccia*, a canal, conduit, pipe, formerly also "a damme of a mill" (*Florio*), ult. < *L. duere*, lead (see *douche*, *duct*), or with *ML. doga*, a ditch, canal, also a vessel, cup, perhaps < *Gr. δοχη*, a receptacle, < *δέχομαι*, receive.] In *hydraulic engin.*, strictly, an inclosed water-space in which a ship floats while being loaded or unloaded, as the space between two wharves or piers; by extension, any space or structure in or upon which a ship may be berthed or held for loading, unloading, repairing, or safe-keeping. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all times nearly the same, as the gate is opened only at full tide, when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes in some degree with the work of loading or unloading. The closed docks are free from this

inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term is also applied to a basin or inclosed water-space for the storage of floating timber or the safe-keeping of river-steamers, barges, or canal-boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The largest closed docks are at Liverpool and London, in England. In a particular sense the term is also applied to the construction and apparatus used in repairing and building ships, as the *floating dock*, *dry-dock*, *depositing-dock*, and *sectional dock*.

The saide shippe, called the Holy Crosse, was so shaken in this voyage, and so weakened, that she was layd vp in the docke, and neuer made a voyage after.

Hakluyt's Voyages, II. i. 98.

Depositing-dock, a caisson or an elevator for lifting vessels from the water and placing them upon stagings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a girder and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the girder is a large floating pontoon, connected with it by two rows of heavy beams that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks till the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.—**Dry-dock**, a dock or an excavated basin adjoining navigable water, provided with a gate, and so arranged that, after the docking of a ship, the water can be exhausted from it. Such docks are long and narrow, with sloping sides formed in steps. The modern method of construction is to excavate the basin in the shore, and to drive heavy piling along the bottom and upon the sloping sides and rear end. Upon the piles are laid heavy timbers to form the floor and the steps at the sides. At the entrance are double gates opening outward, and meeting at an angle when closed, to resist the pressure of the water on the outside when the dock is empty. A recent method of closing a dry-dock is by means of a float-

Dry-dock, or Graving-dock.

ing gate or caisson with flat bottom and wide stem and stern, which is floated into position across the entrance and loaded with water-ballast till it sinks, fitting tightly by a keel into a groove in the gateway. To use the dock, the gate is opened, or floated away at high water, and the ship is drawn into the dock and held afloat over a line of blocks along the center of the dock. The gate is then put in position, and sunk till the dock is closed water-tight. The water within the dock is then exhausted by steam-pumps, leaving the ship supported on the blocks, and braced on both sides by shores extending to the dock-steps. A typical dry-dock is the Brooklyn Navy-yard Dock No. 1, which is 500 feet long, 60 feet wide at the bottom, and capable of admitting a ship drawing 18 feet. Steam-pumps with a capacity of 40,000 gallons of water a minute are used to empty it.—**Floating dock**, a capacious wooden or iron structure, generally rectangular, intended to serve as a graving-dock. Sometimes floating docks are built in water-tight compartments, and can be sunk to the required

Side and End Elevations of Floating Dock.

depth by the admission of water into these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and

lowered on the same principle. A floating dock may also be made so heavy as to sink by its own weight deep enough to receive the largest vessel, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.—**Graving-dock**, a dry-dock: so called because used in graving or cleaning the bottom of ships. The graving-docks in the navy-yards of Brooklyn, Boston, and Norfolk are important examples.—**Half-tide dock**, a basin connecting two or more docks, and communicating with the entrance-basin.—**Sectional dock**, a floating dock composed of a succession of pontoons or caissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the caissons, and, as they float, the vessel is raised.

2. In a university, one who has passed all the degrees of a faculty, and is thereby empowered to teach the subjects included in the faculty; a person who has received the highest degree in a faculty: as, a doctor in divinity. The degree is also regularly conferred by certain technical schools, as those of medicine, and, under certain conditions, by colleges. An honorary degree of doctor, as of divinity or laws, is often conferred by universities and colleges. The degree of doctor differs only in name from that of master. When there was but one degree in each faculty, the graduate was called a master in Paris, a doctor in Bologna. The faculty of the decretals being modeled after that of Bologna, those who took the highest degree in law were called doctors. This title was afterward extended to masters in theology, and finally to masters in medicine. The degrees of doctor conferred by universities, colleges, and professional schools include doctor of divinity (*L. divinitatis doctor*, abbreviated *D. D.*; or *sacrae theologie doctor*, abbreviated *S. T. D.*; or *de theologie doctor*, abbreviated *D. T.*); doctor of medicine, abbreviated *D. M.* (*L. medicinae doctor*, abbreviated *M. It received its name from statements contained in President Monroe's annual message to Congress in December, 1823, at the period of a suspected concert of the powers in the Holy Alliance to interfere in Spanish America in behalf of Spain. The following are the most

significant passages in the message: "We could not view an interposition for oppressing them [the Spanish-American republics] or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States." "The American continents should no longer be subjects for any new European colonial settlement."
 The only thing which the *Monroe Doctrine* really contains is the intimation on the part of the United States of a right to resist attempts of European Powers to alter the constitutions of American communities.
G. P. Fisher, Outlines of Universal Hist., p. 602.
 = *Syn. 1.* Precept, *Doctrine, Dogma, Tenet.* Precept is a rule of conduct, generally of some exactness, laid down by some competent or authoritative person, and to be obeyed; it differs from the others in not being especially a matter of belief. (See *principle*.) *Doctrine* is the only other of these words referring to conduct, and in that meaning it is biblical and obsolescent. In the Bible it refers equally to teaching as to the abstract truths and as to the duties of religion: "In vain they do worship me, teaching for doctrines the commandments of men." (Mat. xv. 9.) As distinguished from *dogma* and *tenet*, *doctrine* is a thing taught by an individual, a school, a sect, etc., while a *dogma* is a specific doctrine formulated as the position of some school, sect, etc., and pressed for acceptance as important or essential. *Dogma* is falling into disrepute as the word for an opinion which one is expected to accept on pure authority and without investigation. *Tenet* is a belief viewed as held, a doctrinal position taken and defended. It is equally applicable to the beliefs of an individual and of a number; it has no unfavorable sense.

faces of an ordinary icosahedron. It has 12 faces, 12 vertices, 30 edges, 5 sides per face, and 5 sides per vertex. The form approximating most closely to it is the pentagonal dodecahedron, or the pyritohedron, in which the faces are five-sided, but not regular pentagons.—**Regular dodecahedron**, in geom., a dodecahedron whose faces are all regular polygons, and whose vertices are all regular solid angles. It is one of the thirteen Archimedean solids.

dodo (dō'dō), *n.* [*< Pg. doudo, a dodo, < doudo, doido, a simpleton, a fool, < doudo, doido, adj., simple, foolish. According to Diez, this word, which is unknown in Spanish, came from England (?): E. dial. (Devon) dold, stupid, confused: see dolt. Cf. booby, a bird so named for a similar reason. The bird was also named by the Dutch (1) walgh-vogel, now walg-vogel, lit. 'nauseous bird'; also (2) dod-aers, lit. 'dead-arse,' 'proper fedam posterioris partis crassitiem' (note dated 1626), or because of some resemblance to the dabchick or little grebe, which was also so called; also (3) dronte (> Dan. dronte = Sw. dront); origin unknown. The NL. name is *didus*, Sp. *dido*: see *Didus*.*] A recently extinct bird of Mauritius, *Didus ineptus*.

tus, the type of the family *Dididae* and suborder *Didi*, now usually assigned to the order *Columba*. The dodo was living in Mauritius on the discovery of that island by the Portuguese under Mascarenhas in the beginning of the sixteenth century, and it is known to have survived until July, 1681. Knowledge of the bird was for some time confined to the quaint and often questionable narratives of voyagers, certain pictures, mostly by Dutch artists, and a few fragmentary remains. In 1866 bones in abundance were found, and the osseous structure has been described in detail. The dodo was a massive, clumsy, flightless, and defenseless bird, about as large as a swan, covered with downy feathers, with a very stout hooked bill, short strong legs, short tail, and wings too small for flight; so that it soon succumbed under the new conditions which the occupation of the island introduced, its extinction being probably due as much to the animals which man introduced as to the human invaders of the island. The solitaire (*Pezophaps solitaria*) of Rodriguez, an island of the same group, was similar to the dodo, but sufficiently distinct to be placed in a different genus. (See *solitaire*.) The neighboring island of Réunion or Bourbon also had a dodo, in all probability a third kind.

You shall receive . . . a strange fowle: which I had at the Iland Mauritius called by y^e Portingalls a *Do Do*: which for the rareness thereof I hope will be welcome to you.
 Emanuel Alitham, letter written in 1628.

[This is the earliest known English mention of the bird.]

The *Dodo* comes first to a description: here and in Dygarrois (Rodriguez) (and no where else, that I ever could see or hear of) is generated the *Dodo* (a Portuguese name it is, and has reference to her simpleness), a Bird which for shape and rareness might be call'd a Phoenix (wer't in Arabia).

dog (dog or dôg), *n.* [Early mod. E. also *dogge*, *dogge*; < ME. *dog*, *dogge*, < AS. *dogga* (found only once, in a gloss, in gen. pl. *doggena*) = MD. *dogge*, D. *dog* = LG. *dogge*, > G. *dogge*, dial. *dog*, *docke* = Sw. *dogg* = Dan. *dogge*, a dog, mastiff; cf. (from LG. or E.) OF. and F. *dogue* = Sp. *dogo* = Pg. *dogo*, *dogue* = It. *dogo*, a mastiff, bulldog; origin unknown. The general Teut. and Indo-European name for the dog appears in *hound*, *q. v.* Hence in comp. *bandog*, *bulldog*, etc.] 1. A quadruped of the genus *Canis*, *C. familiaris*. The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be from a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and the dingo of Australia being wild descendants from domesticated ancestors. The view now generally taken by naturalists is that the dog is neither a species, in the zoological sense, nor even the descendant of any one species modified by domestication, but that the dogs of different parts of the world have a correspondingly various ancestry, from different wild species of the genus *Canis*, as wolves, foxes, and jackals. This view is supported not only by the enormous differences between dogs, but also by the readiness with which nearly all dogs cross with their wild relatives; and, accordingly, the name *Canis familiaris* is a conventional rather than a proper zoological designation of the dog as a species. No satisfactory classification of the different kinds of dogs has been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. An old classification grouped dogs in three classes, the *Celeres*, *Sagaces*, and *Pugnaces*. Colonel Hamilton Smith groups the domestic dog into six sections: (1) The *wolf-dogs*, including the Siberian, Eskimo, Newfoundland, Great St. Bernard, sheep-dog, etc.; (2) *watch- and cattle-dogs*, including the German boar-hound, Danish dog, dog

of the North American Indians, etc.; (3) the *greyhounds*, as the different kinds of greyhound, Irish hound, lurcher, Egyptian street-dog, etc.; (4) the *hounds*, as the blood-hound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, poodle, etc.; (5) the *cats*, including the terrier and its allies; (6) the *mastiffs*, including the different kinds of mastiff, bulldog, pug-dog, etc. All these are artificial varieties, having comparatively little stability, their distinctive characters being soon lost by reversion to a more generalized type if they are left to interbreed. This tendency to reversion requires to be constantly counteracted by "artificial selection" at the hands of breeders, in order that the several strains may be kept pure, and their peculiarities be perpetuated along the desired lines of specialization. The best-bred dogs, of whatever kind, are those furthest removed from an original or common type of structure. The differences between dogs of all kinds are vastly greater than those found among individuals of any species in a state of nature; so great that, were they not known to be artificial, the dog would represent several different genera of the family *Canidae* in ordinary zoological classification. In fact, some genera, based upon actual and constant differences in the dental formula, have been named in order to signalize certain structural modifications which are found to exist, affording an example of the evolution of generic characters as well as of specific differences. These variations extend not only to size and general configuration, character of the pelage, and other outward features, but also to positive osteological and dental peculiarities, more marked probably than those of any other domesticated animals. The corresponding physiological and psychological differences are equally decided, as witnessed in the dispositions and temperaments of dogs, their comparative docility, intelligence, etc., and consequently the uses to which they are or may be put. In the matter of size alone, for example, some toy dogs are tiny enough to stand easily on one of the fore paws of a large dog. Throughout the endless varieties, however, the influence of heredity is witnessed in the readiness with which dogs interbreed with one another, and cross with wolves, foxes, and jackals, bearing fertile progeny in all cases, and the readiness with which they revert to the wild state of their several ancestors. See the names of the several breeds. See also *Canidae* and *Canis*.

Now is a *dogge* also dere that in a dych lygges.

Aliterative Poems (ed. Morris), li. 1792.

Many pretty ridiculous aspersions are cast upon *dogges*, so that it would make a *dogge* laugh to hear and understand them: as, I have heard a man say, I am as hot as a *dogge*, or as cold as a *dogge*; I sweat like a *dogge* (when indeed a *dogge* never sweats); as drunk as a *dogge*; he swore like a *dogge*; and one told a man once that his wife was not to be believ'd, for shee would lye like a *dogge*.

Eskimo dog, one of a breed of dogs extensively spread over the northern regions of America and of eastern Asia. It is rather heavier than the English pointer, but appears smaller on account of the shortness of its legs. It has oblique eyes, an elongated muzzle, and a bushy tail, which characteristics give it a wolfish appearance. The color is generally a deep dun, obscurely barred and patched with a darker color. It is the only beast of burden in arctic latitudes, and with a team of such dogs attached to his sledges the Eskimo can travel 60 miles a day for several successive days.—**Field-dog**, a dog used for the pursuit of game in the field. In the United States the term is commonly applied to pointers and setters.—**Hunting-dog**. (a) A dog used for hunting. (b) The painted hyena or cynhyene. There are several varieties of this dog, the principal being a very large breed with broad muzzle, head carried well up, noble expression, waving or curly hair, thick and bushy curled tail, black and white color. Another breed is smaller and almost entirely black. Some breeds seem to be crossed with hounds, mastiffs, etc. The Newfoundland dog is remarkable for its sagacity, patience, and good nature, and for its affection for its master. No dog excels it as a water-dog, its broad half-webbed paws making it an excellent and powerful swimmer.—**Pouched dog**, a marsupial, the *Ualacine* dasyure of Tasmania. dog-days (dog'dāz), *n. pl.* A part of the year about the time of the heliacal rising of the dog-star. Various dates, from July 3d to August 15th,

have been assigned for the first dog-day, and various durations, from 30 to 64 days. Pliny says they began with the heliacal rising of Procyon, which took place, he says, July 19th, N. S.; and this date has been widely accepted. But he also says the sun was then entering Leo, which rule, making the dog-days begin July 23d, has also been used. Hippocrates (450 B. C.) says they were in the hottest and most unhealthy part of summer. If the season was of Babylonian origin, it would originally probably have been in early summer. Perhaps they are now most usually reckoned from July 3d to August 11th, inclusive.

The power and dignity of the doges were originally very great, but gradually became limited through the jealousy of the Venetian aristocracy. In Genoa the dignity was established in the fourteenth century; the doge was at first elected for life, but from the first part of the sixteenth century the term was restricted to two years, and the authority of the doge became more limited. The office disappeared in Venice in 1797, at the overthrow of the republic, and in Genoa in the same year, although there was a temporary restoration of it in the latter city a few years later.

The term *Dogger Series*, however, is generally taken to include not only the dogger proper, but the gray and yellow sands which underlie it. The Dogger Series rests upon the alum shale (Upper Lias) in Yorkshire, where *dogger* is a provincial word meaning a rounded stone, in allusion to the rounded appearance caused by atmospheric action on the large blocks into which the rock is divided by joints. The dogger is much worked for the iron ore which it contains. This name as used by Continental geologists is the equivalent of that part of the Jurassic series which corresponds to the Lower Oolite of the English geologists. It is the Brown Jura of the Germans, and is there divided into three groups, distinguished by their fossil remains. The entire series consists of many alternations of clays, marls, shales, and sandstones, frequently containing iron ore, as is the case in England.

2. In the Kantian philosophy, a dogmatic method in metaphysics; an uncritical faith in the presumptions of reason.

Our critique is not opposed to the dogmatical procedure of reason, as a science of pure knowledge (for this must always be dogmatical—that is, derive its proof from sure principles, a priori), but to dogmatism only—that is, to the presumption that it is possible to make any progress with pure philosophical knowledge, consisting of concepts, and guided by principles, such as the reason has long been in the habit of employing, without first inquiring in what way, and by what right, it has become possessed of them. Dogmatism is therefore a dogmatical procedure of pure reason, without a previous criticism of its own powers.

2. The monetary unit or standard of value of the United States and Canada, containing 100 cents, and equal to about 4s. 1½d. English.

In the United States it is represented in the currency by gold and silver coins and by notes; in Canada by notes only. A two-dollar gold coin is current in Newfoundland. This unit was established in the United States under the confederation of the States, by resolution of

Congress, July 6th, 1787. It was represented by a silver piece, the coinage of which was authorized by the act of Congress, August 8th, 1786, by which was also established the decimal system of coinage. The coinage was not begun until two years after the law of April 2d, 1792, establishing the mint. That law provided for the coinage of "dollars or units, each to be of the value of a Spanish milled dollar," as that coin was then current, and to contain 371½ grains of pure silver, or 416 grains of standard silver. The Spanish dollar above mentioned was that that struck in Spanish America. Spanish-American dollars, and coins representing halves, quarters, eighths, and sixteenths of them (the last two known as *shillings* and *szepcenes* in New York and some other States, and by other names elsewhere), were abundant in the United States during the latter part of the eighteenth and the first half of the nineteenth century. The Spanish dollar coined in Spain was rare, but the intrinsic value of the two coins was the same. By an act of January 18th,

Dollar of the United States, 1795
(Size of the original.)

1837, the dollar was made to consist of 412½ grains of fine, the quantity of pure silver remaining the same, 371½ grains. This dollar, being worth in market value from 100 to 104 cents, went out of circulation. An act of March 3d, 1849, directed the coining of gold dollars of 25.8 grains of fine, 23.22 being pure gold; and by act of February 12th, 1873, this was declared the unit of value of the United States. An act of February 28th, 1878, directed the Secretary of the Treasury to purchase silver bullion, not less than \$2,000,000 nor more than \$4,000,000 per month, and cause it to be coined into standard silver dollars. The coins representing fractional parts of the dollar are: in silver, the half-dollar and quarter-dollar, or 50-cent and 25-cent pieces, and the dime or 10-cent piece; in nickel, the half-dime or 5-cent piece (originally in silver, and inconveniently small); and in bronze, the cent (originally in copper, and much larger) and the 2-cent piece. There is also a 3-cent piece, originally coined in silver and afterward in nickel, which has been little used owing to its inconvenient smallness in both forms. By the term *dollar* in the United States notes is intended the coined dollar of the United States, a certain quantity in weight and fineness of gold or silver, authenticated as such by the stamp of the government. Sometimes abbreviated *do.*, but commonly represented by the symbol \$ (the dollar-mark) before the number.

The Almighty *Dollar*, that great object of universal devotion throughout our land, seems to have no genuine devotees in these peculiar villages.

The Congress of 1792 fixed the monetary unit of the United States in coin, gave it the name *Dollar*, made it the unit of the money of account in their offices and courts, [and] named also its multiples and fractions.

cromlech. The name is sometimes given also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is probably that known as the Pierre Couverte near Saumur, in France. It is 64 feet long, 14 feet wide,

Constantine Dolmen, Cornwall.

and about 6 feet high, and consists of four upright stones on each side, one at each end, and four on the top. The great stone of the dolmen represented in the accompanying cut is 33 feet long, 14½ feet deep, and 18½ feet across; it is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchers, although afterward they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of a primitive rude dwelling, and may sometimes have been the actual structure in which the savage sheltered himself, converted afterward into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Circassia, Algeria, and Europe; but too much importance may be attached to this, as the inclosed dolmen is simply the structure which savages of a very low type, of whatever race, would naturally erect for shelter. See *cromlech* and *menhir*.

2. In law, the place where a person has his home, or his principal home, or where he has his family residence and personal place of business; that residence from which there is no present intention to remove, or to which there is a general intention to return. The domicile depends not on citizenship, nor on presence, but on the concurrence of two elements: 1st, residence in a place; and 2d, the intention of the person to make that place his home. Thus, a man may be a citizen of one country, have his domicile in another, and temporarily reside in a third. Domicile is of three kinds: 1st, *domicile of origin* or *nativity*, depending on that of the parents at the time of birth; 2d, *domicile of choice*, which is voluntarily acquired by the party; and 3d, *domicile by operation of law*, as that of a wife arising from marriage. The term *domicile* is sometimes used to signify the length of residence required by the law of some countries for the purpose of establishing jurisdiction in civil actions; in Scotland, residence for at least forty days within the country constitutes a domicile as to jurisdiction. All questions relating to personal property, in matters of debt, intestacy, or testamentary disposition, are determined by the law of the place of domicile, while those relating to real property are subject to the law of the place where it is situated. The property of a foreigner domiciled in a country with which his own is at war is held to be subject to seizure as that of an alien enemy.

It would be more correct to say that that place is properly the *domicil* of a person in which his habitation is fixed without any present intention of removing therefrom.
Story, Conflict of Laws, iii. § 43.

Dominical or Sunday letter, one of the seven letters A, B, C, D, E, F, G, used in calendars to mark the Sundays throughout the year. The first seven days of the year being marked by the above letters in their order, the following seven and all consecutive sets of seven days to the end of the year are similarly marked, except that in leap-years the 24th and 25th of February receive the same letter: so that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays of the year, except in leap-year, when after February 24th the dominical letter for the remainder of the year changes to the one preceding. (Many modern writers make the change of letter to occur after the end of February, the 29th taking no letter.) After twenty-eight years the same letters return in their order. The use of the dominical letter is primarily to aid in determining the date of Easter: but it may be used, by calculation, for finding the day of the week on which a given date falls in any year, let *p*, *q*, *r*, *s*, respectively, be the digits in the thousands, hundreds, tens, and units' places of the number of the year. Then, if the year is new style, find the sum $6p + 2q + 5r + 4s + 1$, and diminish it by the quotient of the year divided by 400 (neglecting the remainder). If it is old style, form the sum $3(p + 1) + q + 5r + 4s$. In either case increase the result by double the remainder after dividing the year by 4 (this remainder being taken as 4 for January and February of a leap-year). Divide the result by 7, and the remainder is the ordinal number of the dominical letter in the alphabet (the ordinal number of G being called 0).

II. n. One of an order of mendicant friars instituted by the Spaniard Domingo de Guzman in Languedoc in France, and confirmed by the pope in 1216. The official name of the order is *Frates Predicatores* (rendered in English, *Friars Preachers, Preaching Brethren or Friars, Predicants, or Order of Preachers*), preaching and instruction being the chief objects of its foundation. It was established by Dominic himself also in Italy and Spain, and spread rapidly in other countries. In England its members were called *Black Friars*, from their black cloaks, and in France *Jacobins*, from the church and hospital of St. Jacques (Jacobus), in which they were first established in Paris. Their rules, based upon those of St. Augustine, enjoin poverty, chastity, fasting, and silence; but the last two may be dispensed with when they would interfere with active duties. The officers of the order are all elective. The highest, holding his place six years, is termed general; provincial and conventual priors have charge respectively of provinces and convents. The Dominicans and Franciscans, originating about the same time and long vehement rivals, were the leading orders of the Roman Church until the rise of the Jesuits in the sixteenth century. They still exist in many countries, but with reduced influence. The dress of the order is a black mantle and a white habit and scapular. An order of Dominican nuns was also founded by Dominic.

Donatist (don'a-tist), *n.* [*LL. Donatista*, *Donatist*, < *Donatus*, a man's name.] One of an early Christian sect in Africa which originated in a dispute over the election of Cæcilian to the see of Carthage, A. D. 311, occasioned by his opposition to the extreme reverence paid to relics of martyrs and to the sufferers for the Christian faith called confessors, and the rivalry of Secundus, primate of Numidia. Secundus and the Numidian bishops declared Cæcilian's consecration invalid because conferred by Felix of Aptunga, whom they charged with being a traitor. They excommunicated Cæcilian and his party, and made one Majorinus bishop in opposition. The name Donatist came either from Donatus of Cassi Nigra, who headed the party of Majorinus at the Lateran Council in 313, where it was condemned, or (more probably) from Donatus ("the Great," who succeeded Majorinus in 315 and under whom the schism became fixed. Repressed under Constantine, the Donatists revived under the favor of Julian the Apostate. Repressive measures, provoked by their frequent acts of fanatical violence, were resorted to from time to time. These measures, internal schisms, the conciliatory conduct of the orthodox clergy at a conference held at Carthage in 411, and the arguments of St. Augustine caused many to abandon Donatism, and the sect became insignificant, though not entirely extinct till the seventh century. The Donatist party held that it constituted the whole and only true church, and that the baptisms and ordinations of the orthodox clergy were invalid, because they were in communion with traitors. They therefore rebaptized and reordained converts from Catholicism. See *Circumcellion*, *Maximianist*, *Primitivist*, *Rogatist*.

A movable barrier of wood, metal, stone, or other material, consisting sometimes of one piece, but generally of several pieces framed together, commonly placed on hinges, for closing a passage into a building, room, or other inclosure. In antiquity, as in China and other Eastern countries at the present day, doors often swung on pivots projecting into sockets above and below. Modern carpenters' doors are classified in general as *batten-doors* and *panel-doors*. Batten-doors are formed of two or more boards placed longitudinally side by side, and held together by two or more transverse rails. Panel-doors are formed of a skeleton framework called a *door-frame*, of which the openings are filled with pieces of stuff called *panels*, which are usually cut from thinner boards than the framework. If the panels are wider than they are high, they are called *lying panels*; if longer than wide, they are called *standing panels*.

Doric cyma. See *cyma*, 1.—**Doric dialect**. See II.—**Doric mode**. See *mode*.—**Doric order**, in arch., the oldest and strongest of the three Greek orders, in its external forms the simplest of all, but in its most perfect examples, especially as exhibited in the monuments of the age of Pericles at Athens, combining with solidity and force the most subtle and delicate refinement of outlines and proportions that architecture has known. In a de-

based and distorted form, the Doric constituted the second order of the Romans, coming between their Tuscan and Ionic. A characteristic of the Grecian Doric column is the absence of a base; the channelings are usually 20 in number, and in section approximate to a semi-ellipse; the capital has generally no astragal, but only one or more fillets or annulets, which separate the channelings from the echinus. The profile of the capital in the best examples is a carefully studied eccentric curve, neither flat enough to be hard in effect, nor full enough to be weak. The echinus prior to the time of perfection spread out far beyond the shaft; the later Greeks made it a frustum of a cone, and the Romans cut it as an ordinary quarter-round. In good Greek examples, as a rule, no horizontal lines are found in a Doric building, floor- and cornice-lines, etc., being curved slightly upward; the profiles of the column-shafts are slightly convex, and all columns are slightly inclined toward the center of the building. All these particularities have relation to optical effects so subtle that their influence is felt rather than seen.

The first of the Roman orders is the Doric, which, like everything else in this style, takes a place about half-way between the Tuscan wooden posts and the nobly simple order of the Greeks. J. Ferguson, Hist. Arch., I. 298.

ratte = *G. schlafratte* (lit. 'sleep-rat'), a dormouse. A rodent of the family *Myozidae*. The dormouse is peculiar among rodents in having no caecum.

The general appearance is squirrel-like, hence the name *squirrel-mice* sometimes given to these animals; but the structure and general affinities are murine. The dormouse are confined to the old world, and are widely distributed in Europe and Asia, with some outlying forms in Africa. Their shape is neat and gracile; they have full eyes, shapely limbs, and a long hairy tail, which in *Myozus* proper is bushy and distichous throughout, in *Muscardinus* bushy but cylindrical, in *Eliomys* tufted and flattened at the end, and in *Graphiurus* shorter and like a lead-pencil. There are about 12 species of the 4 genera named. The common dormouse is *Muscardinus avellanarius*, only about as large as the house-mouse; the fat dormouse or loir (*Myozus glis*) and the garden-dormouse or lerot (*Eliomys nictela*) are both much larger. The dormice hibernate in a lethargic or torpid state, occasionally waking up in mild weather and availing themselves of a stock of provisions which they have hoarded.

2. In law, the portion which the law allows to a widow for her life out of the real property in which her deceased husband held an estate of inheritance. At common law it is one third of such real property held by the husband at any time during the marriage as the common issue of the husband and wife might have inherited, except such property as has been conveyed with the concurrence of the wife. The wife may also bar the right of dower by accepting a jointure. By modifying statutes, in some of the United States, the dower is sometimes a share in fee, and sometimes extends only to property which the husband held at the time of his death. In England, by the Dower Act of 1833, the common-law rights of the wife have been greatly modified, her dower being entirely under the control of the husband. In the earlier periods of the common law several kinds of dower were usual, as *dower ad ostium ecclesie*, which was dower voluntarily pledged by the husband at the porch of the church where the marriage was solemnized; and in this case the share might be less than a third, or (except for a restriction at one time imposed for the protection of the interests of feudal lords) it might be more than a third. This was, sometimes at least, done by the declaration in the marriage service "with all my lands I thee endow," or the husband might specify a particular manor or other lands. If he had no lands, or chose to mention goods only, the declaration was, as now, "with all my worldly goods I thee endow," in which case the wife, if she survived him, was entitled to a third of the personal property left by him; and if he left lands, the law, notwithstanding his omission to promise dower in them, gave her what was called *reasonable dower*, or *dower according to custom*, viz., the life estate in one third as above described, unless she had accepted a jointure or other provision in lieu of dower.

The *dower* of lands in English law . . . belonged to a class of institutions widely spread over western Europe,

very similar in general character, often designated as *dowrium*, but differing considerably in detail.

draft¹, **draught**¹ (*dráft*), *n.* and *a.* [This word has changed in pron. from *draught* (*ME.*) and mod. *Sc. pron. drächt*) to *draft* (*pron. dráft*, *dráft*), and the fact has been recognized by the spelling draft, which, dating from late *ME.*, is now the established form in the military, commercial, and many technical uses, in which the literary traditions in favor of *draught* are less felt; in other uses the spelling *draught* still prevails, though *draft* is not uncommon in many of them. There is no rational distinction between the two forms; *draft* is on all accounts preferable. (The *f* represents the changed sound of the orig. guttural; a similar change is recognized in the spelling *dwarf*.) Early mod. *E.* usually *draught*, rarely *draft* (*dial. also draught, draight*: see *draught*², *draight*), < *ME. draught, draugt, draucht, draht*, also rarely *drafte*, also, with loss of the guttural, *drawte*, a drawing, pulling, pull, stroke, etc., not found in *AS.* (= *MD. draht, draht, D. draht* = *MLG. LG. draht*, a load, burden, = *MHG. tracht, G. tracht*, a load, = *Icel. dráttir*, a pulling, draft of fishes), = *OSw. drækt, Sw. drägt* = *Dan. dragt*, a burden, litter, draft; with formative *-t*, < *AS. dragan*, draw, drag: see *draw*. The uses of *draft* are so numerous and involved that their exhibition in linear sequence is difficult. All the senses attached to the word in either spelling with their quotations are here necessarily exhibited together under *draft*¹, *draught*¹, although, of course, most of the obsolete senses are found only in the older spelling *draught* (in its various *ME.* forms). Modern senses in which the spelling *draught* is still prevalent over *draft* are indicated. In cases not so indicated, *draft* is the prevalent spelling. The compounds in which *draught* is the only recorded spelling are given under that spelling.] **I. n.** 1. The act of drawing or dragging (in any sense); a drawing; a draw; a haul; a pull. A fabulous animal common to the conceptions of many primitive races and times, or, as in the Bible, an indefinite creature of great size or fierceness. When described or depicted, it is represented as either a monstrous serpent or a lizard (like an exaggerated crocodile), or a compound of both, or (as in heraldry) as a combination of mammalian and reptilian characters; but always as winged, with fiery eyes, crested head, and terrible claws. It is often represented as blood-red and spouting fire, and sometimes with several heads, like the Hydra; and in the myths of the Scandinavians and other races, dragons are often the guardians of treasures, etc. The killing of a dragon was reckoned among the greatest feats of heroes in both ancient and medieval times; thus, the legend of St. George and the dragon is one of the most celebrated in Christian literature. The dragon is the imperial emblem of China, and is regarded by the Chinese as a sort of divinity, but by other peoples generally as the type and embodiment of fierceness and cruelty or watchful malice. In the Apocalypse "the old serpent" is a synonym of Satan (Rev. xx. 2). In the Old Testament it is either a large land-animal or a great marine fish (Isa. xxxiv. 13—revised version, jackal; Ps. lxxiv. 13—revised version, dragon), a venomous land-serpent (Ps. xci. 13—revised version, serpent), or the crocodile (Ezek. xxxii. 3—revised version, dragon). The same Hebrew word, *thannin*, is also sometimes translated *vial* (Gen. i. 21—revised version, sea-monster; Job vii. 12—revised version, sea-monster). The extinct pterodactyl comes nearest of all known creatures to the most prevalent conception of a dragon.

A unit of weight less than an ounce.

The *drām* is generally supposed to be of Greek origin. Many weights of this denomination and its multiples have been exhumed at Athens, belonging to different systems, of 57, 67, 75, and 78 grains Troy, and there were doubtless others. The Solonic dram, the Athenian monetary weight, had at first 67.4, later 66.6 grains Troy. The Æginetan weight was greater, and is fixed by the latest authorities as normally 97 grains. A *drām* afterward appears in Phœnician systems as a half or quarter of a shekel; and under the Ptolemies there was in Egypt a *drām* of 54.6 grains Troy. Under the early Roman emperors a *drām* was introduced into the Roman system as $\frac{1}{4}$ of an ounce, equal to 63.2 grains Troy. This relation to the ounce has been preserved in several modern systems. Thus, in apothecaries' weight, a *drām* is $\frac{1}{4}$ of an ounce, or 60 grains, divided into 3 scruples of 20 grains each. The avoirdupois *drām*, however (derived from the Spanish *adarme*), is only $\frac{1}{8}$ of an ounce, or 27 $\frac{1}{2}$ grains. In the old Spanish apothecaries' weight a *drām* was $\frac{1}{4}$ of an ounce. In the Neapolitan system 10 *drāms* made an ounce of 412 $\frac{1}{2}$ grains Troy. The Nuremberg *drachm* was 57.5 grains Troy. The Tuscan *dramma* was 54.8 grains Troy. In the Arabian systems the *drām* is properly represented by the mital, but the derham is often called a *drām*, and was in fact derived from the Attic *drachma*. Abbreviated *dr*.

We are not dieted by *drachms* and scruples, for we cannot take too much.

Donne, Letters, xxvii.

In medical use commonly written *fluidrachm*.

drama (drā'mā), *n.* [= *F. drame* = *Sp. Pg. drama* = *It. dramma* = *D. G. Dan. drama* = *Sw. dram*, *drama* (first in *E.*, in the common heading of plays, *dramatis personæ*), < *LL. drama*, < *Gr. δράμα* (τ-), a deed, act, an action represented on the stage, a *drama*, esp. a tragedy, < *δράω* = *Lith. darau*, do.] 1. A story put into action, or a story of human life told by actual representation of persons by persons, with imitation of language, voice, gesture, dress,

and accessories or surrounding conditions, the whole produced with reference to truth or probability, and with or without the aid of music, dancing, painting, and decoration; a play.

The church was usually the theatre wherein these pious dramas were performed, and the actors were the ecclesiastics or their scholars.

Westward the course of empire takes its way;

The four first acts already past,

A fifth shall close the drama with the day;

Time's noblest offspring is the last.

Bp. Berkeley, Arts and Learning in America.

A drama is the imitation (in a particular way) of an action regarded as one, and treated as complete. In the observation of the process of a complete action, and in the attempt to imitate it in accordance with such observation, must therefore be sought the beginnings of the drama.

A. W. Ward, Eng. Dram. Lit., Int., p. xvii.

2. A composition in verse or prose, or in both, presenting in dialogue a course of human action, designed, or seemingly designed, to be spoken in character and represented on the stage; a form of imitated and represented action regulated by literary canons; the description of a story converted into the action of a play, and thereby constituting a department of literary art: as, the classic drama; the Hindu drama; the Elizabethan drama. The construction of such a composition is, as a general rule, marked by three stages: first, the opening of the movement; second, the growth or development of the action; third, the close or catastrophe, which must in all cases be the consequence of the action itself, as unfolded in acts, scenes, and situations. The drama, whether in actual life or mimic representation, assumes two principal forms, namely, tragedy and comedy; and from modifications or combinations of these result the mixed or minor forms, known as tragedy-comedy, melodrama, lyric drama or grand opera, opera bouffe, farce, and burlesque. Other forms, suggested by the subject and the manner of presenting it, are the nautical drama, the pastoral drama, the society drama, etc. Both tragedy and comedy attained a high degree of development in the ancient Greek drama, which originated in the worship of Bacchus.

Sophocles made the Greek drama as dramatic as was consistent with its original form. Macaulay, Milton.

It is sometimes supposed that the drama consists of incident. dredging-machine (drej'ing-ma-shēn'), *n.* An apparatus for lifting mud and silt from the bottoms of rivers, harbors, canals, etc. Some dredging-machines employ a single bivalve or clam-shell scoop; others a series of scoops on an endless chain; others some form of suction apparatus. The earliest form appears to have been a single box-like shovel or spoon, suspended from a crane rigged up on a large flat-boat. It was lowered into the mud, dragged along by means of ropes till filled, and then raised and emptied into the boat. Another early form is the chapelot or chain-pump, which, by means of an endless chain carrying buckets traveling in a trough, lifts mud and water, discharging them at the top into a flat alongside the machine. On this plan are now built some of the largest and most powerful dredging-machines in use. They consist of large, flat-bottomed

Steam Dredging-machine.

boats, usually of iron, with a bucket-chain carrying nearly 40 buckets, each with a capacity of about 13 cubic feet. In excavating the Suez canal, the lifting buckets of some of the larger machines had a capacity of 5 cubic feet each, and the delivery was 20 buckets a minute. For the delivery of the sand or spoil both chutes and traveling buckets were used, the spoil being, in some instances, delivered 230 feet from the dredger. The clam-shell dredger is largely used in the United States, and has the merit of ease of management, the scoop operating in a half-circle about the boat, so that a wide channel can be excavated without moving the boat. The scoop is suspended from a crane at the bow of the boat, and is operated by means of chains controlled by steam-power, two long flexible poles serving as guides for the clam-shell. In the machines employing a suction or exhaust, a tube is lowered into the mud, and the mud and water are raised by means of a revolving disk in the tube, or by the aid of a vacuum or an ejector. A large vessel on the boat, being exhausted of air, is connected with the submerged pipe, when the mud and water readily rise into the receiver. In another form of pneumatic dredger a pipe is lowered into the silt and closed air-tight, and steam is then turned into the upper part of the pipe, driving out the air. Many other forms are used.

Dred Scot case. See *case1*.

5. In *geol.*, loose detrital material, fragments of rock, boulders, sand, gravel, or clay, or a

mixture of two or more of these deposits, resting on the surface of the bed-rock. The term *drift* was introduced by Lyell in 1840, to take the place of *diluvium*, with which latter word the idea of a universal deluge, and especially the Noachian deluge, had been generally associated. (See *diluvium*.) The word *drift* is now usually applied to detrital deposits when it is intended to include at the same time the transportation from a distance. Almost all detrital material has, however, been formed with more or less help from running water, and therefore must in that process have been moved to a greater or less distance from the place of its origin. It is especially with reference to material lying on the surface in northern Europe and northeastern North America that the term *drift* is used at present by geologists, and it is frequently called *northern drift*, since much of it has been moved in a southerly direction. And since ice is believed by most geologists to have been the principal agent by which this drift was moved, it is also denominated *glacial drift*, while the detrital material transported by the agency of ice at the present time is not so called. See *glacier* and *moraine*.

6. In *mining*, a nearly horizontal excavation made in opening or working a mine: nearly the synonym of *level*. Such machines vary in form and size from a small hand-implement sowing one row to the gang-drill drawn by one or two horses, and heavy steam-power machines drawn by a rope from a traction-engine, as in steam-plowing. Horse-power drills are sometimes fitted with self-feeding devices for regulating the speed and the amount of feed from the hopper to the tubes that convey the seed to the ground. They all have some form of share or tool for opening or preparing the ground for the seed, immediately in front of the tube that distributes the seed. (a) A drill or borer which cuts by means of diamonds set like teeth in an annular bit or boring-head. Its action is rapid, but it leaves a rough surface, and must be followed by a finishing-tool.—*Lip drill*, any flat drill upon the cutting edge of which a lip is formed, either by grinding or during the process of forging. The lip adds to the speed and cleanness of working.—*Persian drill*. (a) A hand-drill operated by a nut moved backward and forward over a quick screw on the stock of the drill. It is a form of single-acting metal-drill.—*Teat drill*, a square-faced cylindrical drill with a sharp, pyramidal projection or teat issuing from the center of the cutting face. It is used to flatten or finish the bottoms of holes.—*Twist drill*, a cylindrical drill around the body of which is carried a deep spiral groove, so that the tool appears as if twisted from a flat bar. The point is sharpened to an obtuse angle. Such drills are used in all sizes, from a diameter of three inches down.—*Vertical drill*, a drill with a vertical spindle. E. H. Knight.—*Wall-drill*, a drilling-machine set up against a wall, and not fitted with a table to receive the work. —4. In *glass-making*, one of the lumps or globules formed in the glass by the glazing of the clay cover of the melting-vessel and its combination with the volatilized alkalis. The crude glass thus formed on the cover drops into the molten glass in the vessel, rendering it defective.

dropping-tube (drôp'ing-tüb), *n.* Same as *dropper*, 1 (a).

drop-press (drôp'pres), *n.* A swaging-, stamping-, or forging-machine having either a regular or an intermittent motion. It is essentially a power-hammer moving between vertical guides, and delivering a dead-stroke blow either from its own weight or by weight combined with power. In simple machines the weight is raised above the anvil by hand by means of a cord, and let fall; but as these machines are wasteful of labor they have been largely superseded by power-machines, in which the weight is raised by a strap wound over a drum, or by a wooden slat pressed between two pulleys revolving in opposite directions, or by direct connection with a wrist on a disk-wheel. The weight is either released at any point of its path by some simple device controlled by a lever within reach of the operator's hand or foot, or it descends by the movement of the disk. If a spring is interposed between the weight and the lifting apparatus, whatever its form, to absorb the recoil, it is called a *dead-stroke hammer* or *press*. In the drop-presses employing a strap or other lifting device that is released at the will of the operator, the blows are intermittent. Where the connection with a wheel is direct, the blows are regular and uniform so long as the machine works. All things shaped from hot metals on a drop-press, such as small parts of machines, are called *drop-forgings*. The drop-press is sometimes called simply *press*, and sometimes *drop-hammer*. It should not be confounded with the stamping-press, which, while it is allied to the drop-press, differs essentially in its manner of working.

drop-shutter (drôp'shut'êr), *n.* In *photog.*, a device for rendering the exposure of a plate in a camera very brief: used in instantaneous photography. The most simple form, also known as the *guillotine shutter*, and the one that gives a name to all other appliances of the kind, consists of two opaque pieces, each pierced with a hole, and arranged to slide one over the other. One of the pieces is fitted over the lens-tube, and when the openings in the two pieces are in line, the shutter admits light to the camera. When it is desired to make a very short exposure, the movable slide is raised till the opening of the tube is closed. On letting the slide fall, the opening in it passes before that in the fixed piece, and for an instant light is admitted to the plate behind the lens. To accelerate the fall of the slide, various devices are used, as springs or elastic bands. Improved drop-shutters have the form of revolving disks actuated by springs, etc., or that of flap-shutters controlled by a pneumatic device, etc.; and in many the opening is made to take place eccentrically, or the holes in the shutters are out of various shapes, with the object of distributing the light, and giving a greater volume of light to the foreground or the lower portion of the picture, which is naturally not so well lighted as the higher portions.

Pacific islands, and most abundantly in extratropical Australia. Their leaves are covered with glandular hairs, which exude drops of a clear glutinous fluid that glitter in the sun; hence the name *Drosera*, and in English *sundew*. These glandular hairs retain small insects that touch them, and other hairs around those actually touched by the insect bend over and inclose it. The excitement of the glands induces the secretion of a digestive fluid, under the operation of which the nutritious nitrogenous matter of the insect is dissolved and absorbed. The common European species have long had a popular reputation as a remedy for broucheitis and asthma.

A musical instrument of the percussive class, consisting of a hollow wooden or metallic body and a tightly stretched head of membrane which is struck with a stick. Three

principal forms are used: (1) cylindrical, with one head and an open bottom, usually called a *tambourine* or *Egyptian drum*; (2) hemispherical, with one head, usually called a *kettledrum*; (3) cylindrical, with two heads, one of which can be struck, as in a side-drum or snare-drum, or both of which can be struck, as in the bass drum. Macaulay, Hist. Eng., vii.

Macaulay's memory, like Niebuhr's, undoubtedly confounded not infrequently inference and fact; it exaggerated; it gave, not what was in the book, but what a vivid imagination inferred from the book. Sir George Lewis had none of this defect; his memory was a dry memory, just as his mind was a dry light; if he said a thing was at page 10, you might be sure it was at page 10.

Various processes for preparing dry plates have been experimented with almost since the earliest diffusion of photography; but most of these processes afforded plates of very uncertain quality, slow in operation, and exceedingly unavailable in their property of keeping. Dry plates have comparatively recently come into general use, in great measure superseding the old wet plates, owing to the adoption of gelatin as a medium for the sensitizing agent (bromide of silver), which is formed into an emulsion with the gelatin, and spread in a thin film upon some support, as glass, paper, or metal. Such plates require a remarkably short exposure to make a picture, are very convenient to handle, since the operator can make a number of exposures at one time and place, and can perform the chemical operations of development, etc., at his convenience, weeks afterward, if necessary, at any other place, instead of being forced, as with wet plates, to finish his picture at once. Moreover, the gelatin film is so tough that it is hardly necessary to varnish a dry-plate picture, as is indispensable with the tender collodion film; and these plates can be prepared commercially at small cost and of even quality. Their chief defect is that they cannot, as now made, be trusted to keep unimpaired in warm weather, while unexposed or undeveloped, longer than about two months, or even less.—**Dry process**. See *process*.—**Dry season**, a fishing season during which fish are scarce. [*Local*, New England.]—**Dry service**. See *dry mass*, under *mass*.—**Dry way**, a method of assaying by the aid of fire, or in a furnace or muffle: the opposite of assaying in the *humid way*, when the combination to be assayed, or, more properly, analyzed, exists in solution, or in the liquid form.—**High and dry**. See *high*.—**To boil dry**. See *boil*.

Damp, unventilated situations are most favorable to the development of dry-rot fungi. Dry wood is not attacked. Various methods have been proposed for the prevention of dry-rot; that most in favor is to thoroughly saturate the wood with creosote, which makes it unfit for vegetation. (See *kyanizing*.) Animal dry-rot is also found to be occasioned by the attack of fungi.

Muir, Principles of Chemistry.

In the Mazdean or Zoroastrian religion we have the best example of a dualistic faith. Faiths of the World, p. 350.

Huxley, Nineteenth Century, XXI. 192.

The principle of duality, in geom., the principle that in any proposition not involving measure, if for "point" be everywhere substituted "plane," and vice versa, the latter proposition will be as true as the former.

Upon this supposition of a positive curvature, the whole of geometry is far more complete and interesting; the principle of duality, instead of half breaking-down over metric relations, applies to all propositions without exception.

duck² (duk), *n.* [= *Sc. duik*, *duke*, *dook*, < ME. *ducke*, *dukke*, *doke*, *dokke*, *duke*, < AS. *duce* (found only in gen. *ducan*), a duck, lit. a ducker, < **ducan* (pret. pl. **ducon*, pp. **dōcen*), *duck*, *dive*: see *duck¹*, *v.* *cf.* *ducker*, 3; *Dan. duk-and*, *dyk-and*, a sea-duck (*and*, *duck*: see *drake¹*); Sw. *dyk-fågel*, diver, plungeon (*fågel* = *E. fowl*). So *diver*, *dipper*, *dopper*, etc., names applied to diving birds.] 1. A lamellirostral natatorial bird of the family *Anatidae* and subfamily *Anatinae* or *Fuligininae* (which see). The technical distinction between any duck and other birds of the same family, as geese and morganans, is not clear; but a duck may usually be recognized by the broad and flat bill, short legs, scutellate tarsi, and entirely feathered head. The common wild duck or mallard is *Anas boschas*, the feral stock of the domestic duck. The species of ducks are numerous, about 125, divided into some 40 modern genera, and found in nearly all parts of the world. Most ducks fall in one or the other of two series, fresh-water ducks or river-ducks, *Anatinae*, and salt-water ducks or sea-ducks, *Fuligininae*; and from the latter a few are sometimes detached to form a third subfamily, *Eristasturinae*; but the implied distinction in habits by no means holds good, since some or any river-ducks may be found in salt water, and few if any sea-ducks are entirely maritime. The mallard and closely related species now form the restricted genus *Anas*. Teal are small ducks, chiefly of the genus *Querquedula*; *Q. circea* is the garganey. The widgeons form the genus *Mareca*; the gadwalls, *Chavaleasmus*; the spoonbills, *Spatula*; the pintails or sprigtails, *Dafila*. Certain arboreal ducks of various parts of the world constitute the genus *Dendrocygna*. The muscovy duck or musk-duck is *Cairina moschata*. The celebrated mandarin-duck of China and the wood-duck or summer duck of the United States are two species of the genus *Aix*, *A. galericulata* and *A. sponsa*. Sheldrakes or burrow-ducks are of the genus *Casarea* or *Tadorna*. A number of sea-ducks with black or red heads are placed in genera variously named *Fuligula*, *Fulke*, *Aythya*, *Nyroca*, etc.; such are the scaups and pochards, the canvasbacks, and others. The buffheads, goldeneyes, and whistlings belong to a ge-

century, by the Norman duke Roger II. In 1283 a gold ducat was struck in Venice, but the piece was afterward called a *zecchino* (sequin), the ducat becoming only a money of account. (See def. 2.) The earliest gold coins of Germany seem to have been called *ducates*, and this name was applied to German gold coins of the sixteenth and seventeenth centuries. Gold coins called *ducats* were also issued in the Netherlands, in Hungary, and elsewhere. The value of the ducat varied but little, the coin usually containing from 3.42 to 3.44 grams of fine gold, worth from \$2.27 to \$2.32.

If every *ducat* in six thousand *ducats* Were in six parts, and every part a *ducat*, I would not draw them. Shak., M. of V., iv. 1.

Take you a *ducket*, or your chequing of gold, and apply to the place affected.

Sandys, Travels, p. 11.

2. An old money of account in the Venetian republic.

nus variously called *Clangula*, *Glaucion*, and *Bucephala*. The harlequin duck is *Histrionicus histrionicus* or *H. minutus*. The old-wife or long-tailed duck is *Harelda glacialis*. The Labrador duck, *Camptolampus laboratorius*, is notable as being probably on the point of extinction; it is a near relative of the steamer-duck of South America, *Micropod. teres cinereus*. Eiders are large sea-ducks of the genus *Somateria* and some related genera. Scoters and surf-ducks, also called sea-coots, are large black sea-ducks of the genus *Edemia* and its subdivisions. The ruddy ducks belong to the genus *Eristamora* and some related genera. Fishing-ducks, so called, are not properly ducks, but mergansers (*Merginae*).

A single combat; specifically, a premeditated and prearranged combat between two persons with deadly weapons, and usually in the presence of at least two witnesses, called *seconds*, for the purpose of deciding a quarrel, avenging an insult, or clearing the honor of one of the combatants, or of some third party whose cause he champions. The origin of the modern practice of dueling was doubtless the judicial combat or wager of battle resorted to in the middle ages as a means of settling disputes. The practice was formerly common, but has generally been suppressed by adverse public opinion in civilized countries. In England and the United States dueling is illegal, death resulting from this cause being regarded as murder, no matter how fair the combat may have been; and the seconds are liable to severe punishment as accessories. *Deliberate dueling* is where both parties meet avowedly with intent to murder. In law the offense of dueling consists in the invitation to fight; and the crime is complete on the delivery of a challenge.

In Great Britain, France, Italy, Spain, and Portugal, a hereditary title of nobility, ranking next below that of *prince*, but in some instances a sovereign title, as in those of the dukes of Burgundy, Normandy, Lorraine, etc. (see *3.* below), or borne as his distinguishing title by a prince of the blood royal. The first English duke was Edward the Black Prince, created Duke of Cornwall in 1337. Dukes, when British peers, sit in the House of Lords by right of birth; Scotch and Irish dukes have a right of election to it, in common with other peers of those countries, in certain proportions; in other countries, except Germany (see below), the title conveys no prescriptive political power. In Great Britain a duke's coronet consists of a richly chased gold circle, having on its upper edge eight strawberry-leaves, with or without a cap of crimson velvet, closed at the top with a gold tassel, lined with sarsenet, and turned up with ermine.

Modena and Parma, in Italy, were ruled by sovereign dukes until their incorporation with the kingdom of Italy in 1860.

They have no stated places of worship, observe no holy days, reject the use of images and all rites and ceremonies, have no ordained clergy, and do not acknowledge the divinity of Christ or the authority of the Scriptures, to which they give, in so far as they accept them, a mystical interpretation. Owing to their murders and cruelties, they were removed to the Caucasus in 1841 and subsequent years; they now form a community there of seven villages.

dulcarnon, *n.* A word occurring in the phrase to be at *dulcarnon*—that is, to be at a loss, to be uncertain what course to take. It is found in the following passage from Chaucer:

"I am, til God me bettere mynde sende,
 At *dulcarnon*, right at my wittes ende,
 Quod Pandarus, "Ye, nece, will ye here?
Dulcarnon called is 'femyng of wrecches';
 It semeth hard, for wrecches wol nought lere,
 For veray slouth, or other wilful teches."
Troilus, iii. 931.

Dulcarnon represents the Arabic *dhū l-karnain*, 'lord of the two horns,' a name applied to Alexander, either because he boasted himself the son of Jupiter Ammon, and therefore had his coils stamped with horned images, or, as some say, because he had in his power the eastern and western world, signified in the two horns. (Selden's *Preface* to Drayton's *Polyolbion*.) But the epithet was also applied to the 47th proposition of Euclid, in which the squares of the two sides of the right-angled triangle stand out something like two horns. This proposition was confounded by Chaucer with the 5th proposition, the

famous *pons asinorum*. This, for some reason, was in the middle ages termed *Elefuga*, which is explained as meaning 'flight of the miserable,' or, as Chaucer renders it, 'fleming of wretches.' *Ele* was supposed to be derived from *elegi*, meaning miserable, and this latter was itself derived from *elegia*, meaning sorrow. The passage from Chaucer was first thus explained in the London *Athenaeum*, Sept. 23, 1871, p. 393.

The tones are produced by striking the strings with hammers, the heads of which have both hard and soft sides, so that different qualities and degrees of force are possible. The dulcimer is a very ancient instrument. It is specially notable because it was the prototype of the pianoforte, which is essentially a keyed dulcimer—that is, a dulcimer whose hammers are operated by keys or levers. The immediate precursor of the pianoforte, however, the harpsichord, was a keyed psaltery. See *harpsichord*, *psaltery*, *pianoforte*.

Lastly, *hyperdulia*, which is only
